

## Abstract of the Disclosure

A multiplier type fishing reel has a frame, two side plates which are mounted on the frame, a line spool which is mounted in the frame and rotatable about an axis of rotation, and a first and a second brake for braking the line spool. The braking effect of the first brake is adjustable with the aid of a first adjusting means which is turnable about an axis parallel to the axis of rotation and the braking effect of the second brake is adjustable with the aid of a second adjusting means which is turnable about an axis parallel to the axis of rotation. The first and the second adjusting means are arranged in one of the side plates and have respectively a first and a second tooth portion. An operating means, which is turnable about an axis parallel to the axis of rotation, is mounted on said one side plate and has at least one tooth element meshing with both tooth portions to make, in turning of the operating means, respectively the first and the second adjusting means turn for adjusting the braking effect of the respective brakes on the line spool.
